Count4U

PROJECT PRESENTATION: PRP 372S

Business Case

Student:	**SAFIYA ABDULKADIR ELMI: 240500598**
Course:	**PRP372S**

1. Executive Summary

Count4U is a stock and sales management system designed for spaza shop owners. It helps users manage products, record sales, monitor stock levels, and view daily sales information. The purpose of the project is to make everyday shop management easier and reduce the need to calculate sales and check stock manually.

2. Problem Statement

Spaza shop owners may manage their stock by looking at products on shelves and use calculators to work out sales. This can make it difficult to keep track of available stock, identify low-stock products, and understand which products sell well.

Count4U aims to address these challenges by providing a simple system for managing stock and sales in one place.

3. Proposed Solution

Count4U is a web-based application developed using PHP, MySQL, HTML, CSS, JavaScript, and Bootstrap. The system allows users to:

- Add and manage products.
- Record sales and calculate totals.
- Update stock when products are added or sold.
- Receive low-stock alerts.
- View daily sales.
- Identify best-selling and slow-selling products.

4. Objectives and Benefits

The main objectives of Count4U are to:

- Make stock management easier.
- Simplify sales calculations.
- Help shop owners monitor stock levels.
- Provide information about daily sales and product performance.
- Reduce reliance on manual calculations and stock checking.

5. Project Scope

The project focuses on the main stock and sales management functions required by a small spaza shop. It includes user accounts, product management, sales recording, stock updates, low-stock alerts, and sales information.

Advanced features such as integration with external payment or supplier systems are outside the current project scope and may be considered for future development.

6. Feasibility

Technical feasibility: The system was developed using PHP, MySQL, and web technologies available for the project.

Operational feasibility: The application provides aa easy way for users to manage products and sales through a web interface.

Financial feasibility: The project uses commonly available development tools and technologies.

7. Risks and Limitations

The system depends on users entering correct product, stock, and sales information. Incorrect entries may affect the accuracy of the information displayed. The application also requires access to the deployed website and a suitable device with a web browser.

Future improvements could include supplier integrations and additional features to support shop operations.

8. Conclusion and Recommendation

Count4U provides a practical digital solution for managing stock and sales in a spaza shop. It brings important functions together in one system and helps users monitor products, sales, and stock levels more easily.

It is recommended that the system be further tested with spaza shop owners to gather feedback and identify improvements for future versions.
